

Covered Call Report

February 2024

Key Takeaways

Takeaway 1 – U.S. Markets Ride High on AI

Transitioning into 2024, the positive price momentum that had been exhibited by many of the major domestic indices appeared to be tapering. However, as the February roll period stretching from January 19th to February 16th ensued, so too did this momentum. Driven by tech earnings and a positive outlook for builders of AI infrastructure, the S&P 500 and Nasdaq 100 delivered total returns of 3.56% and 2.22%, respectively, during the period.¹

Takeaway 2 – Call Premiums Reflect Changing Investor Sentiments

Although volatility metrics characterizing the price movements of the broader markets trended upward with relative consistency during the February roll period, option premiums associated with many of our covered call funds, with which they generally share a relatively tight positive correlation, remained relatively flat or contracted to a modest degree. Much of this activity could be attributed to put options growing to make up a larger portion of the trading mix, as illustrated by the Cboe Index Option Put/Call Ratio (1.34x on February 16th).² The happening underscored the impact that pure supply and demand dynamics can have on option premiums, as call option values came under pressure.

Takeaway 3 – Federal Reserve Policy Uncertainty Could Promote Volatility

A primary contributor to the recent rise in volatility was a Consumer Price Index (CPI) report that displayed year-over-year price inflation of 3.1%, 20 basis points ahead of expectations.³ As markets continue to weigh the impact of corporate earnings, employment, and spending on future rate decisions, the opportunity for more volatile trading patterns remains ever present.

Volatility And Skew Are Pressuring Call Prices

Option premium values are a general product of supply and demand, and a key influencer of that demand is volatility. Given the positive relationship that exists between option premiums and volatility, its depressed nature across most major domestic indices is having a negative impact on call prices. Concurrently, the ratio of index puts to calls is placing a higher premium on put option protection, of late, and this may diminish the value of calls, as well.

Major Domestic Index Volatility

Source: Global X ETFs and Bloomberg as of 12/31/2023. ¹All returns over 1-Year are displayed as annualized returns. ²XYLD data from 6/21/2013 to 12/31/2023. QYLD data from 12/11/2013 to 12/31/2023. RYLD data from 4/17/2019 to 12/31/2023. DJIA data from 2/23/2022 to 12/31/2023. XYLE data from 2/21/2023 to 12/31/2023. QYLE data from 2/21/2023 to 12/31/2023. EMCC data from 11/7/2023 to 12/31/2023. ³12-Trailing Month Premium data is measured from 01/21/2022 to 12/15/2023. For funds in existence for less than one year such as EMCC, figure represents cumulative premiums through year end. ⁴These funds typically earn income dividends from stocks and options premiums. These amounts, net of expenses, are typically passed along to the shareholders of these same funds as dividends from net investment income. The Funds realize capital gains from writing options and capital gains or losses whenever it sells securities. Any net realized long-term capital gains are distributed to shareholders as "capital gain distributions." A portion of the distribution may include a return of capital. These do not imply rates for any future distributions.

The performance data quoted represents past performance. Past performance does not guarantee future results. The investment return and principal value of an investment will fluctuate so that an investor's shares, when sold or redeemed, may be worth more or less than their original cost and current performance may be lower or higher than the performance quoted.

Enhancing Retirement Portfolios with Global X's Options Strategies

Historically, many Americans have sought to retire in their early to mid-60's. However, in the recent economic environment, these traditional goals have come to appear somewhat ambitious. The uphill battle stems partly from the difficulties that the traditional 60/40 equity and fixed income portfolio strategy has faced in recent years. In particular, a fixed income allocation focused on US-dollar-denominated investment grade bonds only yielded about 2.6% in aggregate over the last decade, while inflation has ticked upward with relative consistency.¹ The backdrop has likely left many retirees inclined to take on more stock market exposure as they seek to sustain their cost of living. And though the interest rate hikes made by the Federal Reserve (Fed) in 2022 and 2023 have led yields to show improvement, the value of many pre-existing bonds has fallen precipitously in response.² Although "there is no alternative (TINA)" has grown to represent a popular refrain in recent years amongst investors, we believe that Global X's options suite, which consists of a variety of covered call strategies and risk management opportunities, might provide some alternatives that can potentially boost the yield on, or reduce market and interest rate risks associated with, a retirement portfolio.

Key Takeaways

- Lagging bond performance coupled with longer life expectancies and potential adjustments to social retirement programs make harnessing a 60/40 portfolio to retire at 65 less feasible than in the past.
- Global X's Covered Call suite offers the potential to fill an income gap in a retiree's portfolio from both yield and total return perspectives.
- Global X's Collar and Tail Risk strategies may help keep retirees invested amid extreme market downturns, as they offer long equity exposure and a degree of downside protection.

GLOBAL X ETFs RESEARCH

Augmenting Exposure to Information Technology with Covered Calls

Investors focused on growth often allocate significant capital to the Information Technology sector, a segment of the market that tends to experience wider peaks and valleys than others, according to historical implied volatility metrics.¹ That said, as a function of long-term economic growth, the peaks tend to come about with greater frequency, and they often represent primary reasons why some investors can outperform their respective portfolio benchmarks.

After these peaks occur, employing a strategy that can help investors protect their assets or generate returns can be a material differentiator in a portfolio. For example, strategies that systematically write covered call options may be able to create a stream of income when capital appreciation potential may be limited. The premiums that they receive can also be reinvested to support future growth and help cushion against market declines. The Global X Information Technology Covered Call & Growth ETF (TYLG) is one such strategy that writes call options on 50% of its notional holdings monthly and distributes the lower of half its premium received or 1% of its NAV, while reinvesting the balance of the premium back into the fund.

Key Takeaways

- The Information Technology sector was one of the primary drivers of U.S. economic growth in 2023. However, with many of its leaders recently establishing new 52-week high stock prices, investors might be somewhat concerned over how far valuations can stretch.
- Option premiums are more than just a source of current income. The opportunity to reinvest this acquired capital adds dimensions to its total return potential and could help support growth-oriented accounts.
- Investors interested in covered call option strategies are not strictly required to cap price appreciation potential entirely. Writing calls on half the notional balance of an investment can generate income and keep long exposure intact.

QYLD - Exploring the Case for a Nasdaq 100 Covered Call Strategy

At the onset of 2023, a combination of factors dampened investor sentiment as it pertained to U.S. equities. Among them were rising interest rates and recessionary concerns that dented consumer confidence. As the first half unfolded, however, markets found support in the form of decelerating inflation, resilience in jobs reports, and strong positive revenue revisions for major players in the tech space. The breadth of this rally was narrow, driven by a small constituency of mega-cap names in the Nasdaq 100 Index. However, now that share gains have grown more broad based, where markets may go from here and what investors can do in them represent some big questions. In this environment that features higher valuations, covered call option strategies can provide opportunities to hedge positions and generate current income. Among them is the [Global X Nasdaq 100 Covered Call ETF \(QYLD\)](#).

Key Takeaways

- The Nasdaq 100 Index has increased precipitously in value so far this year, but momentum has slowed in recent months, and investors may be looking for a way to hedge their positions.
- The Global X Nasdaq 100 Covered Call ETF (QYLD) is a fully covered buy-write strategy that uses the Nasdaq 100 as its reference asset. Providing a potential stream of premium income, the fund acts as a competitive total return solution that may boost a portfolio's current yield.
- Covered call investment strategies can bring visibility, a variety of diversification benefits, and risk mitigation potential to a portfolio.

Option Terminology

Term	Description	Term	Description
Call Option	An option that gives the holder the right to buy an underlying asset from another party at a fixed price over a specific period of time.	Moneyness	A measure of intrinsic value of an option, that is, it will tell the option holder whether exercising the option will be profitable.
Put Option	An option that gives the holder the right to sell an underlying asset to another party at a fixed price over a specific period of time.	At-the-Money	An option in which the underlying's price equals the strike price.
Long Call	A position in a call option contract in which one has the exercisable right under the contract. This position reflects a bullish attitude.	In-the-Money	Options that, if exercised, would result in the value received being worth more than the payment required to exercise.
Short Call	A position in a call option contract one has in which the right under the contract can be exercised against oneself. This reflects bearish attitude.	Out-of-the-Money	Options that, if exercised, would require the payment of more money than the value received and therefore would not be currently exercised.
Long Put	A position in a put option contract in which one has the exercisable right under the contract. This reflects bearish attitude.	Cboe Index Option Put/Call Ratio	Measures the ratio between the volume of all index put options and all index call options being traded on a daily basis.
Short Put	A position in a put option contract one has in which the right under the contract can be exercised against oneself. This reflects bullish attitude.	Premium	The amount of money a buyer pays and seller receives to engage in an option transaction.
Market Price	The current price of the underlying asset of the option contract, such as a stock.	Covered Call	An option strategy involving the holding of an asset and sale of a call option on the same asset.
Strike Price	The fixed price at which an option holder can buy or sell the underlying asset. Also called 'exercise price'.	Expiration Date	This is the day an options contract ceases to exist.

Option Terminology (continued)

Term	Description	Term	Description
Cboe Volatility Index	Commonly referred to as VIX, reflects a market estimate of future volatility of the U.S. stock market, based on the weighted average of the implied volatilities of the S&P 500.	Cboe Nasdaq-100 Volatility Index	Measures the market's expectation of 30-day volatility implicit in the prices of near-term Nasdaq-100 Options.
Cboe Russell 2000 Volatility Index	Measures the market's expectation of 30-day volatility implicit in the prices of near-term Russell 2000 Options.	Cboe DJIA Volatility Index	Measures the market's expectation of 30-day volatility implicit in the prices of near-term Dow Jones Industrial Average Options.

Important Information

Important Information

Investing involves risk, including the possible loss of principal. Concentration in a particular industry or sector will subject the Funds to loss due to adverse occurrences that may affect that industry or sector. Investors should be willing to accept a high degree of volatility in the price of the fund's shares and the possibility of significant losses.

The Funds engage in options trading. An option is a contract sold by one party to another that gives the buyer the right, but not the obligation, to buy (call) or sell (put) a stock at an agreed upon price within a certain period or on a specific date. A covered call option involves holding a long position in a particular asset and writing a call option on that same asset with the goal of realizing additional income from the option premium. By selling covered call options, the funds limit their opportunity to profit from an increase in the price of the underlying index above the exercise price, but continues to bear the risk of a decline in the index. A liquid market may not exist for options held by the fund. While the fund receives premiums for writing the call options, the price it realizes from the exercise of an option could be substantially below the indices current market price.

Companies with favorable ESG attributes may underperform the stock market as a whole. As a result, QYLE and XYLE may underperform other funds that do not screen companies based on ESG attributes. The criteria used to select companies for investment may result in the Fund investing in securities, industries or sectors that underperform the market as a whole, forgoing opportunities to invest in securities that might otherwise be advantageous to buy or underperform other funds screened for ESG standards.

International investments may involve risk of capital loss from unfavorable fluctuation in currency values, from differences in generally accepted accounting principles, or from economic or political instability in other nations. Emerging markets involve heightened risks related to the same factors as well as increased volatility and lower trading volume.

QYLD, QYLE, DJIA, QYLG, DYLG, TYLG, HYLG, and FYLG are non-diversified.

Important Information (Continued)

Shares of ETFs are bought and sold at market price (not NAV) and are not individually redeemed from the Fund. Brokerage commissions will reduce returns. Beginning October 15, 2020, market price returns are based on the official closing price of an ETF share or, if the official closing price isn't available, the midpoint between the national best bid and national best offer ("NBBO") as of the time the ETF calculates current NAV per share. Prior to October 15, 2020, market price returns were based on the midpoint between the Bid and Ask price. NAVs are calculated using prices as of 4:00 PM Eastern Time. The returns shown do not represent the returns you would receive if you traded shares at other times. Indices are unmanaged and do not include the effect of fees, expenses or sales charges. One cannot invest directly in an index.

This material must be preceded or accompanied by the funds' current prospectuses. Please read the prospectus carefully before investing.
