

### FUND OBJECTIVE

The Global X Intermediate-Term Treasury Ladder ETF (MLDR) seeks to provide investment results that correspond generally to the price and yield performance, before fees and expenses, of the FTSE US Treasury 3-10 Years Laddered Bond Index.

For informational purposes only. This document should be used to highlight some of the criteria to be used by index provider when publishing index constituents and is not comprehensive.

### KEY FEATURES

Exposure

Laddering  
Technique

### SELECTION

The Underlying Index is designed to measure the performance of a strategy commonly referred to as bond “laddering” as applied to public obligations of the U.S. Treasury that have maturities between 3 and 10 years as of the last business day of February of each year (each an “annual rebalance”).

The index composition is determined using the following selection criteria:

- Treasury bonds issued by the U.S. government.
- Denominated in USD.
- Amount outstanding (excluding Federal Reserve holdings) of at least \$5 billion.
- Bonds must have a time to maturity between 3-10 years, with respect to the rebalance day.
- Excludes: variable rate, fixed-to-floating rate, index-linked, treasury bills, stripped zero coupon, private placements, convertible, savings, dual currency and retail-directed bonds.

### WEIGHTING SCHEME

- The index weights its holdings across seven distinct maturity groups (“ladder rungs”), each of which covers a one-year effective maturity period.
- At annual rebalance:
  - A date window is set, which defines the date range of eligible bond maturities for inclusion within the index.
  - The ladder rung containing securities in the 3 to 4-year effective maturity group (defined at prior annual rebalance) is removed from the index and each subsequent maturity group shifts down by one (e.g. 4 to 5-year effective maturity group through 9 to 10-year effective maturity group become the securities in the 3 to 4-year effective maturity group through 8 to 9-year effective maturity group, respectively). A new 9 to 10-year effective maturity group is added to the index.
  - If a ladder rung does not have any qualifying bonds, the weight that would be allocated to that rung is evenly distributed amongst the other eligible rungs of the index.
  - Ladder rungs are equally weighted, and securities within the ladder rungs are weighted by market capitalization.
- At monthly reconstitution:
  - New eligible bonds can be added; however, existing bonds cannot move between rungs.
  - If new bonds are added, bonds within each ladder rung are re-weighted by market capitalization, holding the relative weight of each rung constant.

### REBALANCES/RECONSTITUTION

- The index follows an annual rebalance schedule, made on the last business day of February.
- The index follows a monthly reconstitution, made on the last business day of each month.
